

BUG REPORT

Manual QA Testing — Web Application

Bug ID	BUG-2024-047	Date Reported	May 10, 2025
Reporter	Sonia Hlel: QA Tester	Environment	Production / Staging
App Version	v2.3.1	Platform	Web — Chrome 124, Windows 1

BUG OVERVIEW

Title	User cannot complete checkout — payment button unresponsive on mobile Safari
Severity	■ Critical
Priority	■ High
Status	■ Open
Feature Area	Checkout / Payment Flow

DESCRIPTION

When a user attempts to complete a purchase on mobile Safari (iOS), the **'Place Order'** button on the final checkout step does not respond to taps. The button appears visually active and shows no disabled state, but clicking/tapping it produces no action — no loading indicator, no error message, and no order submission. The issue is consistent and reproducible across multiple test accounts and sessions.

STEPS TO REPRODUCE

- Open the app on Safari — iPhone 13, iOS 17.4.
- Log in with a valid user account.
- Browse the catalog and add any product to the cart.
- Navigate to the cart and click **'Proceed to Checkout'**.
- Fill in all required shipping details and click **'Continue'**.
- Select a payment method (tested with Visa and PayPal).
- On the final review page, tap the **'Place Order'** button.
- ➡ **Observe:** Nothing happens. No loading, no confirmation, no error.

EXPECTED vs ACTUAL RESULT

■ Expected Result	■ Actual Result
Tapping 'Place Order' should submit the order, display a loading spinner, and redirect the user to a confirmation page with order details.	The button does not respond at all. No spinner, no redirect, no error message. The user is stuck on the checkout page with no feedback.

ENVIRONMENT & REPRODUCIBILITY

Device	iPhone 13 (iOS 17.4)	Reproducible?	■ Yes — 100% of attempts
Browser	Safari 17.4	Frequency	Always
Also tested on	Chrome Android — works fine	Regression?	Not present in v2.2.0

■ ATTACHMENTS

- **screenshot_checkout_button.png** — Final checkout screen showing the unresponsive button
- **screen_recording_bug047.mp4** — Screen recording of the full reproduction steps (42 seconds)
- **console_log_safari.txt** — Browser console output captured during the failed action

■ ADDITIONAL NOTES

This bug completely blocks the purchase flow for all Safari/iOS users, which likely represents a significant portion of the user base. Immediate attention is recommended. The issue may be related to a JavaScript event listener not firing correctly on Safari's WebKit engine — similar issues have been reported with touch events on iOS 17.
